

Role: Tester

In this activity I'm assigned as a tester. My goal is to ensure that the rest API works correctly without any issues. I tested the endpoints such a login, registration that was created by the developer. Verifying the endpoints of the API return VIA JSON file. Joined group calls to assist other tester(s) or members for collaboration Taking screenshots of the results or the code for proof and cooperate

Code Contributions:

I didn't develop the main or client codes since I'm new to github, but I made some that were related to it.

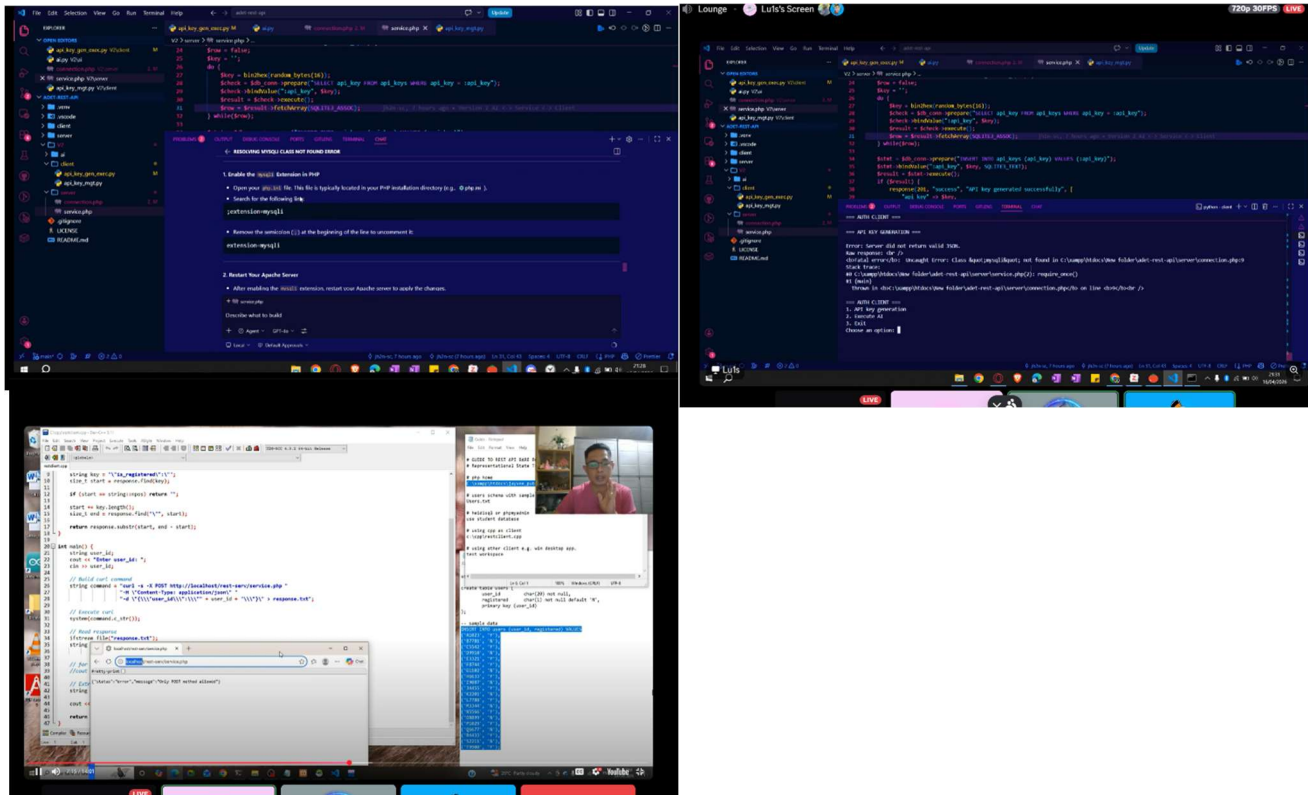

- Running the test cases of the API
- Verifying the JSON
- Solving and finding the issue for any mistake within the code

This will ensure that the system works perfectly under its usage.

I faced so many errors that it's quite hard to solve it despite that It's not a whole project I ask my fellow tester to see if the examples that were observed are correct with types of inputs This activity helps me to learn on how API and JSON work which is useful for Application/Software Development and it needs to be work correctly to ensure that the output will be valid and help the process of this development.
