

Role: V2 Tester

After my groupmates finished developing the main program, I tested the code to ensure that errors during input and bugs during output are accounted for. So far, the only issues that I encountered on my end was running the program. Since the code was run on a different machine, it behaved differently when trying to run it from my end. For example, in php files, I needed to use sqlite so I matched the necessary configurations that my groupmate had to run the app. Another problem was on the client side, in the base URL, in my groupmate's code, it was 127.0.0.1, on my end I changed it to another port for it to work "<http://localhost:9000>". Overall, my role was to make sure that the code behaves as intended and to report any errors to my groupmates.
